Exam Week Planner

Project brief and learning summary

The Task

Create a clear revision timetable for a student preparing for five exams in one week. The schedule had to be built as a real HTML table (not aligned with spaces), with Monday-to-Friday columns, at least five time rows, and correctly merged cells. A subject abbreviation legend was also required.

What the Project Includes

Feature	How it is used
Main timetable	A captioned table with a Time column and Monday through Friday column headings.
Accessible headings	Header cells use scope="col" for columns and scope="row" for time and subject headings.
Merged cells	colspan="2" represents a double Mathematics lesson; rowspan="2" represents a two-hour Science revision session.
Consistent grid	The main timetable has six columns in every row. A cell spanning two rows occupies its position in both rows.
Legend and abbreviations	A list explains MTH, SCI, ENG, HIS, and FRE. Each abbreviation has a descriptive title attribute.
Bonus challenges	A footer (tfoot) reports study hours. A second table lists subjects, revision topics, and confidence ratings from 1 to 5.

What We Learned

• Semantic structure: use <table>, <caption>, <thead>, <tbody>, and <tfoot> to organize tabular information.

• Table cells: use <th> for meaningful headings and <td> for ordinary data cells.

• Accessibility: scope="col" and scope="row" help assistive technologies associate headings with data.

• Spans and grid planning: colspan and rowspan occupy multiple grid positions. Count those positions, not just the written cells, to keep rows aligned.

• Readable abbreviations: a legend explains shortened subject names, while abbr title attributes provide their full names.
